Representation of numbers

◆□ > ◆□ > ◆ Ξ > ◆ Ξ > → Ξ → の < @

# Representation of numbers

Elements of a subset of  $\ensuremath{\mathbb{C}}$  represented by strings (words) of digits

- Positional numeration systems
  - base β in C, |β| > 1
  - ▶ basis  $U = (u_n)_{n \ge 0}$
- Continued fractions
- Residue number system
- Logarithmic number system
- Abstract numeration systems

▶ ...

Representations can be finite, or right infinite, or left infinite words of digits.

## Positional numeration systems

Basis  $U = (u_n)_{n \ge 0}, u_n \in \mathbb{C}$ 

A *U*-representation of  $x \in \mathbb{C}$  on a set *D* of complex digits can be

- ▶ a finite word  $d_k \cdots d_0$ , with  $d_i \in D$ , such that  $x = \sum_{i=0}^k d_i u_i$
- or a right infinite word  $d_1 d_2 \cdots$ , with  $d_i \in D$ , such that  $x = \sum_{i=1}^{\infty} d_i u_i$
- or a left infinite word  $\cdots d_1 d_0$ , with  $d_i \in D$ ,  $x = \sum_{i=0}^{\infty} d_i u_i$

(日) (日) (日) (日) (日) (日) (日) (日)

## Positional numeration systems

Basis  $U = (u_n)_{n \ge 0}, u_n \in \mathbb{C}$

- ▶ a finite word  $d_k \cdots d_0$ , with  $d_i \in D$ , such that  $x = \sum_{i=0}^k d_i u_i$
- or a right infinite word  $d_1 d_2 \cdots$ , with  $d_i \in D$ , such that  $x = \sum_{i=1}^{\infty} d_i u_i$
- or a left infinite word  $\cdots d_1 d_0$ , with  $d_i \in D$ ,  $x = \sum_{i=0}^{\infty} d_i u_i$

(日) (日) (日) (日) (日) (日) (日) (日)

Most significant digit on the left side.

Given a base or a basis, an algorithm  $\mathcal A$  and a set  $S\subset\mathbb C$ :

Does any element of S has an expansion by algorithm A?

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Given a base or a basis, an algorithm  $\mathcal A$  and a set  $S\subset\mathbb C$ :

Does any element of S has an expansion by algorithm A?

What is the canonical digit set produced by algorithm A?

Given a base or a basis, an algorithm  $\mathcal{A}$  and a set  $S \subset \mathbb{C}$ :

- Does any element of S has an expansion by algorithm A?
- What is the canonical digit set produced by algorithm A?
- ► What is the set A(S) of expansions by A of the elements of S?

Given a base or a basis, an algorithm  $\mathcal{A}$  and a set  $S \subset \mathbb{C}$ :

- Does any element of S has an expansion by algorithm A?
- What is the canonical digit set produced by algorithm A?
- ► What is the set A(S) of expansions by A of the elements of S?

Algorithm A : (in general)

Given a base or a basis, an algorithm  $\mathcal{A}$  and a set  $S \subset \mathbb{C}$ :

- Does any element of S has an expansion by algorithm A?
- What is the canonical digit set produced by algorithm A?
- ► What is the set A(S) of expansions by A of the elements of S?

Algorithm A : (in general)

greedy algorithm G, produces most significant digit first

Given a base or a basis, an algorithm  $\mathcal{A}$  and a set  $S \subset \mathbb{C}$ :

- Does any element of S has an expansion by algorithm A?
- What is the canonical digit set produced by algorithm A?
- ► What is the set A(S) of expansions by A of the elements of S?

Algorithm  $\mathcal{A}$ : (in general)

- ► greedy algorithm *G*, produces most significant digit first
- (modified) Euclidean Division algorithm D, produces least significant digit first.

 $U = (u_n)_{n \ge 0}$  with  $u_n = \beta^n$ 

Integer base  $\beta > 1$  in  $\mathbb{N}$ 

Greedy algorithm  $\mathcal{G}$  N positive integer.  $\exists !k$  such that  $\beta^k \leq N < \beta^{k+1}$ .  $N_k := N$ ; for i := k downto 0 do  $d_i := \lfloor \frac{N_i}{\beta^i} \rfloor$ ;  $N_{i-1} = N_i - d_i \beta^i$ ;

 $U = (u_n)_{n \ge 0}$  with  $u_n = \beta^n$ 

Integer base  $\beta > 1$  in  $\mathbb{N}$ 

Greedy algorithm  $\mathcal{G}$  N positive integer.  $\exists ! k$  such that  $\beta^k \leq N < \beta^{k+1}$ .  $N_k := N$ ; for i := k downto 0 do  $d_i := \lfloor \frac{N_i}{\beta^i} \rfloor$ ;  $N_{i-1} = N_i - d_i \beta^i$ ;

#### Euclidean division algorithm $\mathcal{D}$

 $\begin{array}{l} N \text{ positive integer.} \\ N_0 &:= N; \\ i &:= 0; \\ \texttt{repeat} \\ d_i &:= N_i \mod \beta; \quad N_{i+1} &:= N_i \ \texttt{div} \ \beta; \\ i &:= i+1; \\ \texttt{until} \ N_i &= 0; \end{array}$ 

$$N = \sum_{i=0}^{i=k} d_i \beta^i, d_i \in A = \{0, 1, \dots, \beta - 1\}.$$

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ のので

By algorithms G and D, every element of N has a unique finite expansion d<sub>k</sub> · · · d<sub>0</sub>, with d<sub>k</sub> ≠ 0, d<sub>i</sub> in the canonical digit set A = {0, 1, . . . , β − 1}, 0 ≤ i ≤ k. G(N) = D(N) = (A \ {0})A\*.

(日)

- By algorithms G and D, every element of N has a unique finite expansion d<sub>k</sub> · · · d<sub>0</sub>, with d<sub>k</sub> ≠ 0, d<sub>i</sub> in the canonical digit set A = {0, 1, . . . , β − 1}, 0 ≤ i ≤ k. G(N) = D(N) = (A \ {0})A\*.
- By algorithm *G* every element of [0, 1] has a right infinite expansion (*d<sub>i</sub>*)<sub>*i*≥1</sub>, *d<sub>i</sub>* ∈ *A* (and thus every element of ℝ<sub>+</sub>). *G*([0, 1]) = *A*<sup>ℝ</sup> \ *A*<sup>\*</sup>(β − 1)<sup>ω</sup>.

- By algorithms G and D, every element of N has a unique finite expansion d<sub>k</sub> · · · d<sub>0</sub>, with d<sub>k</sub> ≠ 0, d<sub>i</sub> in the canonical digit set A = {0, 1, . . . , β − 1}, 0 ≤ i ≤ k. G(N) = D(N) = (A \ {0})A\*.
- By algorithm *G* every element of [0, 1] has a right infinite expansion (*d<sub>i</sub>*)<sub>*i*≥1</sub>, *d<sub>i</sub>* ∈ *A* (and thus every element of ℝ<sub>+</sub>). *G*([0, 1]) = *A*<sup>ℝ</sup> \ *A*<sup>\*</sup>(β − 1)<sup>ω</sup>.

Every element of Q<sub>+</sub> has an eventually periodic right infinite greedy expansion on A.

- By algorithms G and D, every element of N has a unique finite expansion d<sub>k</sub> · · · d<sub>0</sub>, with d<sub>k</sub> ≠ 0, d<sub>i</sub> in the canonical digit set A = {0, 1, . . . , β − 1}, 0 ≤ i ≤ k. G(N) = D(N) = (A \ {0})A\*.
- By algorithm *G* every element of [0, 1] has a right infinite expansion (*d<sub>i</sub>*)<sub>*i*≥1</sub>, *d<sub>i</sub>* ∈ *A* (and thus every element of ℝ<sub>+</sub>). *G*([0, 1]) = *A*<sup>ℝ</sup> \ *A*<sup>\*</sup>(β − 1)<sup>ω</sup>.
- Every element of Q<sub>+</sub> has an eventually periodic right infinite greedy expansion on A.
- By algorithm D every element of Q has an eventually periodic left infinite expansion on A (p-adic expansion).

By algorithm G every element of [0, 1] has a right infinite expansion (d<sub>i</sub>)<sub>i≥1</sub>, d<sub>i</sub> in the canonical digit set
 A = {0, 1, ..., [β] − 1} (and thus every element of ℝ<sub>+</sub>).

- By algorithm *G* every element of [0, 1] has a right infinite expansion (*d<sub>i</sub>*)<sub>*i*≥1</sub>, *d<sub>i</sub>* in the canonical digit set
   A = {0, 1, ..., [β] − 1} (and thus every element of ℝ<sub>+</sub>).
- ▶ Not every infinite word on *A* is admissible:  $\mathcal{G}([0, 1]) \subsetneq A^{\mathbb{N}}$ .

(日) (日) (日) (日) (日) (日) (日) (日)

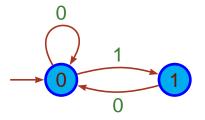

- By algorithm *G* every element of [0, 1] has a right infinite expansion (*d<sub>i</sub>*)<sub>*i*≥1</sub>, *d<sub>i</sub>* in the canonical digit set
   A = {0, 1, ..., [β] − 1} (and thus every element of ℝ<sub>+</sub>).
- Not every infinite word on A is admissible: G([0, 1]) ⊊ A<sup>N</sup>. When β is a Pisot number, G([0, 1]) with the shift forms a sofic dynamical system, i.e., the set of finite factors of G([0, 1]) is recognizable by a finite automaton (Bertrand).

Basis  $U = (u_n)_{n \ge 0}$  with  $u_n \in \mathbb{R}_+$ , summable and strictly decreasing (Muller), by a greedy algorithm. Example  $u_n = \log(1 + 2^{-n})$ ,  $A = \{0, 1\}$ : representation of positive reals by an infinite word on A.

#### Negative base

Negative integer base: Grünwald 1885.

When  $\beta$  is a real number,  $(-\beta)$ -expansions were introduced by Ito and Sadahiro.

Representation of any complex number by a finite or infinite word of natural digits, without separating the real and the imaginary part.

◆□ > ◆□ > ◆豆 > ◆豆 > ̄豆 \_ のへで

Representation of any complex number by a finite or infinite word of natural digits, without separating the real and the imaginary part.

▶ Penney numeration system: every complex number can be expressed with base -1 + i and digit set {0,1}.

(日)

Representation of any complex number by a finite or infinite word of natural digits, without separating the real and the imaginary part.

- ▶ Penney numeration system: every complex number can be expressed with base -1 + i and digit set {0,1}.
- Knuth numeration system: base 2i with digit set  $\{0, \ldots, 3\}$ .

Representation of any complex number by a finite or infinite word of natural digits, without separating the real and the imaginary part.

- ▶ Penney numeration system: every complex number can be expressed with base -1 + i and digit set {0,1}.
- Knuth numeration system: base 2i with digit set  $\{0, \ldots, 3\}$ .

• base  $i\sqrt{2}$  and digit set  $\{0, 1\}$ .

### Rational base $\frac{p}{q} > 1$

- ▶ By  $\mathcal{G}$  every positive real has an aperiodic expansion on  $\{0, 1, \dots, \lceil \frac{p}{q} \rceil 1\}.$
- By D every positive integer has a unique finite expansion on {0, 1, ..., p − 1} (Akiyama, Frougny, Sakarovitch). The set of expansions of elements of N is not context-free.
- ► By D every element of Q has an eventually periodic left infinite expansion.

(日) (日) (日) (日) (日) (日) (日) (日)

Same thing for base  $-\frac{p}{q}$  (Frougny, Klouda).

### Computations

◆□ > ◆□ > ◆ Ξ > ◆ Ξ > → Ξ → の < @

## Distance on the set of infinite words

### Prefix distance on $A^{\mathbb{N}}$ :

$$\rho(\mathbf{v}, \mathbf{w}) = \begin{cases} 2^{-r} & \text{where } r = \min\{i \mid v_i \neq w_i\} \\ 0 & \text{if } \mathbf{v} = \mathbf{w} \end{cases}$$

 $A^{\mathbb{N}}$  is metric compact.

## Distance on the set of infinite words

### Prefix distance on $A^{\mathbb{N}}$ :

$$\rho(\mathbf{v}, \mathbf{w}) = \begin{cases} 2^{-r} & \text{where } r = \min\{i \mid v_i \neq w_i\} \\ 0 & \text{if } \mathbf{v} = \mathbf{w} \end{cases}$$

 $A^{\mathbb{N}}$  is metric compact.

Addition on  $\mathbb{R}$  is continuous, but, addition of expansions base 2 and digit set  $\{0, 1\}$  is not continuous for the prefix distance.

### Distance on the set of infinite words

### Prefix distance on $A^{\mathbb{N}}$ :

$$\rho(\mathbf{v}, \mathbf{w}) = \begin{cases} 2^{-r} & \text{where } r = \min\{i \mid \mathbf{v}_i \neq \mathbf{w}_i\} \\ 0 & \text{if } \mathbf{v} = \mathbf{w} \end{cases}$$

 $A^{\mathbb{N}}$  is metric compact.

Addition on  $\mathbb{R}$  is continuous, but, addition of expansions base 2 and digit set  $\{0, 1\}$  is not continuous for the prefix distance.

$$0(1)^k 0^\omega + 0^\omega = 0(1)^k 0^\omega 0(1)^k 0^\omega + (0)^k 10^\omega = 10^\omega$$

▲ロト▲母ト▲目ト▲目ト 目 のえぐ

### **On-line functions**

A function  $\varphi : A^{\mathbb{N}} \to B^{\mathbb{N}}$  is on-line computable with delay  $\delta$  if  $\exists \delta \in \mathbb{N}$  such that  $(b_n)_{n \ge 1} = \varphi((a_n)_{n \ge 1})$  iff  $\forall n \ge 1$  there exists  $\Phi_n : A^{n+\delta} \to B$  with  $b_n = \Phi_n(a_1 \cdots a_{n+\delta})$ .

### **On-line functions**

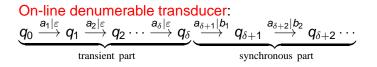

A function  $\varphi : A^{\mathbb{N}} \to B^{\mathbb{N}}$  is on-line computable with delay  $\delta$  if  $\exists \delta \in \mathbb{N}$  such that  $(b_n)_{n \ge 1} = \varphi((a_n)_{n \ge 1})$  iff  $\forall n \ge 1$  there exists  $\Phi_n : A^{n+\delta} \to B$  with  $b_n = \Phi_n(a_1 \cdots a_{n+\delta})$ .

The digit at instant *n* depends only on the past, and not on the future. On-line arithmetic allows the pipelining of different operations such as addition, multiplication and division, because the processing is Most Significant Digit First. Well adapted to real numbers.

### **On-line functions**

A function  $\varphi : A^{\mathbb{N}} \to B^{\mathbb{N}}$  is on-line computable with delay  $\delta$  if  $\exists \delta \in \mathbb{N}$  such that  $(b_n)_{n \ge 1} = \varphi((a_n)_{n \ge 1})$  iff  $\forall n \ge 1$  there exists  $\Phi_n : A^{n+\delta} \to B$  with  $b_n = \Phi_n(a_1 \cdots a_{n+\delta})$ .

The digit at instant *n* depends only on the past, and not on the future. On-line arithmetic allows the pipelining of different operations such as addition, multiplication and division, because the processing is Most Significant Digit First. Well adapted to real numbers.

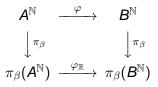

### Proposition

A function on-line computable with delay  $\delta$  is  $2^{\delta}$ -Lipschitz, and thus uniformly continuous.

Numerical value in base  $\beta > 1$ :  $\pi_{\beta} : A^{\mathbb{N}} \to \mathbb{R}$  with  $\pi_{\beta}((a_n)_{n \ge 1}) = \sum_{n \ge 1} a_n \beta^{-n}$ .

If the following diagram commutes,  $\varphi_{\mathbb{R}}$  is the real realization of  $\varphi$  in base  $\beta$ 

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ のので

Proposition (Eilenberg)

If  $\varphi$  is continuous than  $\varphi_{\mathbb{R}}$  is continuous.

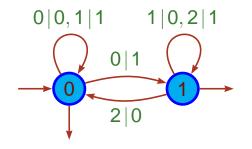

## Finite transducers

A function  $\varphi : A^{\mathbb{N}} \to B^{\mathbb{N}}$  is computable by a transducer  $\mathcal{T} = (Q, A^* \times B^*, E, I, F)$  if the graph of  $\varphi$  is the set of labels of infinite paths starting in *I* and going infinitely often in *F*.  $\mathcal{T}$  is finite if *E* and *Q* are finite.

## Finite transducers

A function  $\varphi : A^{\mathbb{N}} \to B^{\mathbb{N}}$  is computable by a transducer  $\mathcal{T} = (Q, A^* \times B^*, E, I, F)$  if the graph of  $\varphi$  is the set of labels of infinite paths starting in *I* and going infinitely often in *F*.  $\mathcal{T}$  is finite if *E* and *Q* are finite.

Example Addition of reals base 2 and digit set  $\{0, 1\}$  = conversion from  $\{0, 1, 2\}$  to  $\{0, 1\}$ 

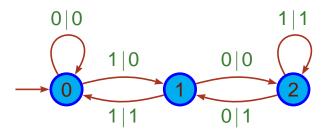

# Sequentiality

 $\mathcal{T} = (Q, A^* \times B^*, E, I, F)$  is sequential if |I| = 1, F = Q, and it is input deterministic.

Processing from left to right: left sequential.

Example Division by 3 in base 2 and digit set  $\{0, 1\}$ .

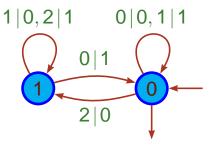

Proposition

A function computable by a finite sequential transducer is uniformly continuous.

# **Right sequentiality**

Processing from right to left

**Example** Addition in base 2 and digit set  $\{0, 1\}$ .

#### Theorem

Any function computable by a finite transducer can be obtained by the composition of a finite right sequential transducer and a finite left sequential transducer.

Finite words: Elgot and Mezei Infinite words: Carton

### On-line finite transducer

Particular left sequential finite transducer.

Example Tent function in base 2 and digit set  $\{0, 1\}$ .

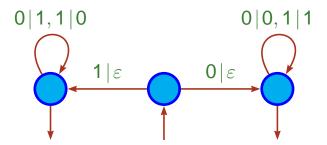

$$f(x) = \begin{cases} 2x & \text{if } 0 \leq x \leq 1/2 \\ -2x+2 & \text{if } 1/2 \leq x \leq 1 \end{cases}$$

### On-line finite transducer

Particular left sequential finite transducer.

**Example** Tent function in base 2 and digit set  $\{0, 1\}$ .

$$f(x) = \begin{cases} 2x & \text{if } 0 \leq x \leq 1/2 \\ -2x+2 & \text{if } 1/2 \leq x \leq 1 \end{cases}$$

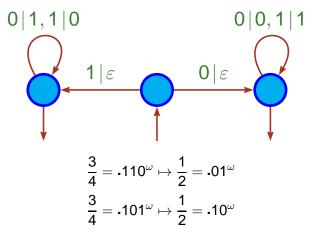

## On-line finite transducer

Particular left sequential finite transducer.

**Example** Tent function in base 2 and digit set  $\{0, 1\}$ .

$$f(x) = \begin{cases} 2x & \text{if } 0 \leq x \leq 1/2 \\ -2x+2 & \text{if } 1/2 \leq x \leq 1 \end{cases}$$

In positive integer base, addition, multiplication by a fixed integer, division by a fixed integer are computable by an on-line finite transducer.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● のへぐ

In positive integer base, addition, multiplication by a fixed integer, division by a fixed integer are computable by an on-line finite transducer.

### Theorem (Muller)

The real realization of a function computable by an on-line finite transducer (in integer positive base) is a piecewise affine function whose coefficients are rational numbers.

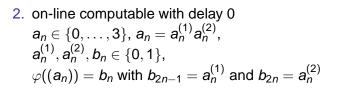

#### Conversion base 4 $\rightarrow$ base 2 is

1. left sequential and right sequential  $0\,|\,00,1\,|\,01,2\,|\,10,3\,|\,11$

3. not computable by a finite on-line transducer

### Local functions

 $\varphi : A^{\mathbb{Z}} \to B^{\mathbb{Z}}$  is a *p*-local function if  $\exists r, t > 0$ , and  $\exists \Phi : A^{p} \to B$ , with p = r + t + 1, such that

 $(b_n)_{n\in\mathbb{Z}} = \varphi((a_n)_{n\in\mathbb{Z}})) \iff \forall n\in\mathbb{Z}, \ b_n = \Phi(a_{n+t}\cdots a_{n-r}).$ 

The image of  $(a_n)_{n \in \mathbb{Z}}$  by  $\varphi$  is obtained through a sliding window of length p.

*r* is the memory and *t* is the anticipation of  $\varphi$ .

 $\varphi$  is called a sliding block code.

### Local functions

 $\varphi : A^{\mathbb{Z}} \to B^{\mathbb{Z}}$  is a *p*-local function if  $\exists r, t > 0$ , and  $\exists \Phi : A^{p} \to B$ , with p = r + t + 1, such that

 $(b_n)_{n\in\mathbb{Z}} = \varphi((a_n)_{n\in\mathbb{Z}})) \iff \forall n\in\mathbb{Z}, \ b_n = \Phi(a_{n+t}\cdots a_{n-r}).$ 

The image of  $(a_n)_{n \in \mathbb{Z}}$  by  $\varphi$  is obtained through a sliding window of length p.

*r* is the memory and *t* is the anticipation of  $\varphi$ .

 $\varphi$  is called a sliding block code.

Locality ensures robustness: no propagation of errors.

A local function on finite words is computable by a parallel algorithm.

### Proposition

A *p*-local function is computable by a finite on-line transducer with delay p - 1. The input automaton is local.

Addition, multiplication, etc...

# Signed-digit representations

Base 10 and digit-set  $\{-5, \ldots, 0, \ldots, 5\}$  Cauchy 1840

Base 10 and digit-set  $\{-6, \ldots, 0, \ldots, 6\}$  Avizienis 1961

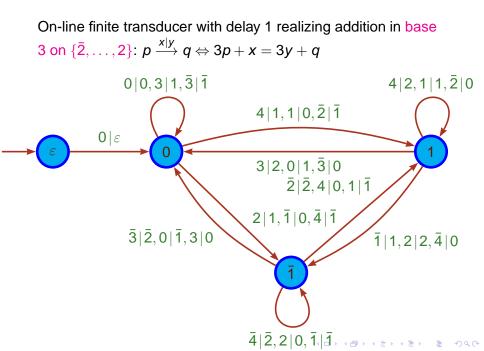

Base 2 and digit-set {-1,0,1} Chow and Robertson 1978

In integer base *b*,  $b \ge 3$ , parallel addition on alphabet  $\{-a, \ldots, 0, \ldots, a\}$ ,  $b/2 < a \le b - 1$  is possible by Avizienis algorithm. It is a 2-local function.

In integer base b = 2a,  $b \ge 2$ , parallel addition on alphabet  $\{-a, \ldots, 0, \ldots, a\}$  is possible by Chow and Robertson algorithm. It is a 3-local function.

### Redundancy

No propagation of the carry.

# Parallel addition

### Theorem (Frougny, Pelantová, Svobodová)

Let  $\beta \in \mathbb{C}$  with  $|\beta| > 1$  be an algebraic number. If all its algebraic conjugates have modulus  $\neq 1$  one can find an alphabet of contiguous integer digits on which addition can be done in parallel.

#### Redundancy is necessary.

We have some lower bounds on the minimality of the cardinality of the digit set.

The result is not necessarily admissible.

# Parallel addition

### Theorem (Frougny, Pelantová, Svobodová)

Let  $\beta \in \mathbb{C}$  with  $|\beta| > 1$  be an algebraic number. If all its algebraic conjugates have modulus  $\neq 1$  one can find an alphabet of contiguous integer digits on which addition can be done in parallel.

#### Redundancy is necessary.

We have some lower bounds on the minimality of the cardinality of the digit set.

The result is not necessarily admissible.

Example Addition in base the golden mean:

► on the minimal alphabet {-1,0,1} is a 21-local function

・ロト・日本・日本・日本・日本・日本

- ▶ on {−3,...,3} is 13-local
- ► on {−5,...,5} is 9-local.

## **On-line addition**

Suitable for real numbers.

In real base ±β, β > 1, addition is on-line computable on {0,..., [β]} (the result is not admissible).

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

## **On-line** addition

Suitable for real numbers.

In real base ±β, β > 1, addition is on-line computable on {0,..., [β]} (the result is not admissible).

• If  $\beta$  is a Pisot number, the on-line transducer is finite.

## **On-line** addition

Suitable for real numbers.

- In real base ±β, β > 1, addition is on-line computable on {0,..., [β]} (the result is not admissible).
- If  $\beta$  is a Pisot number, the on-line transducer is finite.
- To get an admissible result, normalization is necessary: If β is a non-integer Pisot number, normalization is computable by a finite transducer, which is neither left nor right sequential.

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ のので

Real base on-line addition algorithm  $\beta > 1$ ,  $A = \{0, ..., \lfloor \beta \rfloor\}$ On-line algorithm with delay  $\delta$ , where  $\delta$  is the smallest positive integer such that

$$\beta^{\delta+1} + 2\lfloor\beta\rfloor \leqslant \beta^{\delta}(\lfloor\beta\rfloor + 1)$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Input:  $(d_j)_{j \ge 1} \in (A + A)^{\mathbb{N}}$ . Output:  $(a_j)_{j \ge 1} \in A^{\mathbb{N}}$  such that  $\sum_{j \ge 1} a_j \beta^{-j} = \sum_{j \ge 1} d_j \beta^{-j}$ . begin

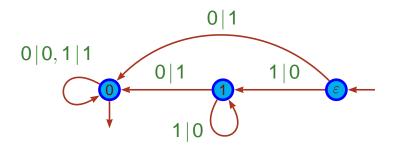

$$\begin{array}{l} q_{0} := 0 \\ \text{for } j := 1 \text{ to } \delta \text{ do} \\ q_{j} := \beta q_{j-1} + d_{j} \\ j := 1 \\ \text{while } j \ge 1 \text{ do} \\ z_{\delta+j} := \beta q_{\delta+j-1} + d_{\delta+j} \\ \text{ if } z_{\delta+j} < \beta^{\delta+1} \\ \text{ then } a_{j} := \lfloor z_{\delta+j} / \beta^{\delta} \rfloor \\ \text{ else } a_{j} := \lfloor \beta \rfloor \\ q_{\delta+j} := z_{\delta+j} - \beta^{\delta} a_{j} \\ j := j + 1 \end{array}$$

end

## Successor function = addition of 1

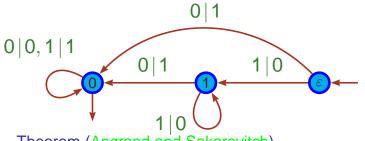

In integer base the successor function  $\langle n \rangle \mapsto \langle n+1 \rangle$  is realizable by a right sequential letter-to letter finite transducer. Successor function base 2:

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ のので

# Successor function = addition of 1

In integer base the successor function  $\langle n \rangle \mapsto \langle n+1 \rangle$  is realizable by a right sequential letter-to letter finite transducer. Successor function base 2:

Theorem (Angrand and Sakarovitch)

Let L be a language ordered by the radix order and recognizable by a finite automaton. The successor function on L is realizable by a finite union of right sequential finite transducers with disjoints domains.

Application: *L* is the set of expansions of  $\mathbb{N}$  in a given numeration system.

## **Multiplication**

- Multiplication is not computable by a finite transducer
- Multiplication is on-line computable
  - in positive integer base b ≥ 2 on {-a,...,0,...,a}, b/2 ≤ a ≤ b − 1 (Ercegovac and Trivedi)
  - ▶ in negative integer base (-b) on  $\{-a, ..., 0, ..., a\}$ , b/2 ≤ a ≤ b - 1
  - in real base β > 1 on {0,..., [β]}. (The result is not admissible) (Frougny and Surarerks)
  - ▶ in the Knuth number system of base  $i\sqrt{b}$ ,  $b \ge 2$  integer, on  $\{-a, \ldots, 0, \ldots, a\}$ ,  $b/2 \le a \le b 1$
  - in the Penney numeration system of base -1 + i on  $\{-1, 0, 1\}$  (Surarerks)

Redundancy is necessary

Real base on-line multiplication algorithm  $\beta > 1$ ,

 $A = \{0, \ldots, \lfloor \beta \rfloor\}$ 

On-line algorithm with delay  $\delta$ , where  $\delta$  is the smallest positive integer such that

$$eta + rac{2\lflooreta
floor^2}{eta^\delta(eta-1)} \leqslant \lflooreta
floor + 1.$$

Input:  $x = (x_j)_{j \ge 1}$  and  $y = (y_j)_{j \ge 1}$  in  $A^{\mathbb{N}}$  such that  $x_1 = \cdots = x_{\delta} = 0$  and  $y_1 = \cdots = y_{\delta} = 0$ .  $X_j = \sum_{1 \le i \le j} x_i \beta^{-i}$ Output:  $p = (p_j)_{j \ge 1}$  in  $A^{\mathbb{N}}$  such that  $\sum_{j \ge 1} p_j \beta^{-j} = \sum_{j \ge 1} x_j \beta^{-j} \times \sum_{j \ge 1} y_j \beta^{-j}$ . begin

$$p_1 := 0, ..., p_{\delta} := 0; W_{\delta} := 0$$
  
 $j := \delta + 1$ 

while  $j \ge \delta + 1$  do

$$W_j := \beta(W_{j-1} - p_{j-1}) + y_j X_j + x_j Y_{j-1}$$
  

$$p_j := \lfloor W_j \rfloor$$
  

$$j := j + 1$$

end

On-line multiplication in base  $\varphi = (1 + \sqrt{5})/2$  on  $\{0, 1\}$ Delay  $\delta = 5$ .  $x = y = .0^5 10101$ . Result  $p = .0^{10} 101000100001$ .

## Concluding remarks

Numbers can be seen as strings or flows of digits, either one by one most significant digit first, or looked at through a sliding window.

# Concluding remarks

Numbers can be seen as strings or flows of digits, either one by one most significant digit first, or looked at through a sliding window.

For application to algorithms, sequentiality and synchronicity are important, as well as finite memory when it is possible.

# Concluding remarks

Numbers can be seen as strings or flows of digits, either one by one most significant digit first, or looked at through a sliding window.

For application to algorithms, sequentiality and synchronicity are important, as well as finite memory when it is possible.

On-line functions: most significant digit first, well adapted to real numbers with infinite expansions. Pipelining with addition, multiplication and division...

Division and square-root, some elementary functions are on-line computable in positive integer base (Ercegovac, Muller)

 Local functions: sliding window, parallel algorithms, adapted to arithmetical circuits. Internal additions in on-line algorithm.

Both need redundancy.
